

Mock Consultation “Background & Briefing” Sheet

Background

This is your second consultation with Bob, your client. Bob left their marriage and shared home with their abusive partner, Alice, last year in January 2025. Bob initially sought help on Feb. 24th, 2025 because they believed their Facebook was hacked. Some of Bob’s friends had received weird messages via Facebook originating from Bob’s account that they did not send, and Bob cannot find them in their own message history. Bob also does not know how Alice got their Facebook password. You helped Bob request their data exports from Facebook and Google, but now they would like help understanding the data since they have an upcoming legal case.

Technology involved

Devices

Bob (client) uses an iPhone XR, and they report that Alice (harmdoer) uses an iPhone 7. They are not on the same phone plan.

Accounts

Bob has an iCloud account, a Google account, and a Facebook account attached to bob.researcher24@gmail.com.

Skill level

Alice is comfortable with technology, but does not have a formal hardware or software background.

What you learned during the first consultation

A walkthrough of Bob’s security settings in all 3 accounts reveals:

- The Facebook account shows logins from an iPhone XR starting 2/27/2025 and updated 3/5/25. It also shows logins from multiple generic iPhones starting 1/21/25.
- The Google account shows an iPhone login in the last 28 days.
- The iCloud account appears to be secure.

Screenshots shown below. You can assume the screenshots and data exports were taken at approximately the same time, in early March 2025.

[Images removed since they show real IP addresses and locations]

*Left: Screenshot of Bob’s Facebook account showing logins from an iPhone and an iPhone XR.
Right: Security settings in Bob’s Google account showing 1 session from Bob’s iPhone.*

During the first consultation, you additionally learn...

- Alice should not have known Bob's Facebook password. Bob has strong password security habits and usually creates random passwords with Google's synced password manager.
- The weird messages were sent around February 20th, 2025.
- After some questions, Bob recalls having trouble logging into their Google account a while ago and having to reset their password.

Your hunch

You suspect that Alice got the Facebook password from Google Password manager. However, Google login history is truncated to last 28 days, so you can't verify if someone logged into their account longer ago than that.

Your Tasks

You are asked to complete 5 tasks using LEStRADE and the reference materials given above. Feel free to speak aloud through your thought process and mention any uncertainties or caveats that come along with your answers to any of the tasks.

1. Identify the time period(s) when Alice's iPhone 7 was actively logged into Bob's Facebook account.
2. Identify the impersonating messages sent from Bob's account in the data export, or justify why you are unable to do so.
3. Determine if each of the generic "iPhone(s)" shown in Facebook's account security interface is (a) Bob's iPhone XR, (b) Alice's iPhone 7, or (c) a different device altogether.
[Images removed since they show real IP addresses and locations]
4. Determine if Alice's iPhone 7 accessed Bob's Google account, and if so, the associated time period(s).
5. [Shown after 4] -- Identify any actions Alice possibly took while they were logged in to Bob's Google Account.
